

Analog Output

CSE 132

1

Today's Outline

- Analog Output
- FSM for Receiving Protocol Messages

2

Pulse Width Modulation (PWM)

- Analog output, built using a digital output
- Technique is to exploit the fact that many physical devices are slow, and respond to average of a fast-moving signal
 - E.g., What does our eye do with 30 frames/sec?
 - Our brain smooths out the motion so it looks continuous to us
- Send digital signal up and down quickly, and the “analog output” is the average value

3

50% Analog Output

- 500 Hz period (2 ms)
- Repeating signal, $\frac{1}{2}$ time 5 V and $\frac{1}{2}$ time 0 V
- Average is 2.5 V

4

10% Analog Output

- Same 500 Hz period (2 ms)
- In this case, 10% time 5 V and 90% time 0 V
- Average is 0.5V

5

90% Analog Output

- Same 500 Hz period (2 ms)
- In this case, 90% time 5 V and 10% time 0 V
- Average is 4.5V

6

analogWrite()

- `analogWrite(pin, value)`
 - pin is one that supports PWM outputs, not all do!
 - value is 8-bit analog value (range is 0 to 255)
- Useful for slow-moving physical devices, e.g.,
 - LEDs (actually, it is our eyes that are slow)
 - 5 V motors (hard to start/stop at 500 Hz)
- Can be used for other devices if averaging is done by circuitry between Arduino and device

7

Use Cases

- LEDs
 - Analog value 255 → full bright
 - Analog value 0 → off
 - Analog value 127 → half intensity
- DC motors
 - Analog value 0 → stopped
 - Analog value 127 → half speed
 - Analog value 255 → full speed
- Servo motors
 - Analog value tells holding position
 - Range 0 to 180 degrees

8

Communications Receiver

- First check to see if byte has arrived
 - Arduino
 - `Serial.available()` returns integer count of available bytes
 - Java
 - `s.available()` returns Boolean if a byte is available
- Next read one (and only one) byte
 - `Serial.read()` on Arduino (returns an int)
 - Return value is -1 if nothing received, byte value otherwise
 - `s.readByte()` on Java (returns a byte)
- Check `available()` prior to *each* read!

10

Not Like This!

```
if (Serial.available() > 0)
    b1 = Serial.read();
if (Serial.available() > 0)
    b2 = Serial.read();
// code that assumes b1 and b2 are good
```

What could go wrong here?

What if the two bytes are sent based on a human pressing a button, and the human takes a while between the two button presses?

11

A Byte Might *Not* Be Available

```
if (Serial.available() > 0)
    b1 = Serial.read();
else
    wait until Serial.available() is > 0!!!!
```

The above looks like it will block (*note*: it will!)
We need to transition to a non-blocking approach
FSMs to the rescue!

12

FSM to Receive 2 Byte Integer

- Initial state: Wait4byte1

- State transition: receipt of a byte
 - `available()` followed by `read()`
 - Save incoming byte on transition

13

FSM to Receive 2 Byte Integer

```
while (true)
  if (Serial.available() > 0)
    inputByte = Serial.read();
    switch (state) {
      case Wait4byte1: b1 = inputByte;
                      nextState = Wait4byte2;
      case Wait4byte2: b2 = inputByte;
                      nextState = Wait4byte1;
                      inputValue = (b1 << 8) + b2;
    }
}
```

14

Receive 2 Byte Integer

- Use FSM to save b1 (first byte) and b2 (second)
- Compose int from 2 bytes:

```
int value = (b1 << 8) + b2;
```
- Watch out for sign extension in Java

```
int value = ((0xff & b1) << 8) + (0xff & b2);
```

 - Because bytes get promoted to int before math operations (silly Java rule)

15

Communications and Delta Time

```
while (true)
  now = millis()
  if (byte available) then
    read byte and save (i.e., FSM)
  endif
  if (delta time has expired)
    do time-based stuff
  endif
endwhile
```

16

Our Protocol

Message format:

Examples:

- MAG_NUM is magic number
- KEY_TIME is key for 4-byte time value
- KEY_TEMP is key for 2-byte temperature

17

FSM to Receive Our Protocol

States:

- A is wait for magic number
- B is wait for key
- C to F wait for bytes of time value
- G to H wait for bytes of temperature value

18

Upcoming Schedule

- No office hours during break
 - No late tickets charged for 7 days
 - Looking to staff office hours Sunday Mar 16
- Assignment 6 due Monday, Mar 17 (just after break)
- Studio 7 is Monday, Mar 17
 - Analog outputs driving motors (drive wheels on car)
- Assignment 7 is due Monday, Mar 24
 - Protocol messages both directions
 - Non-blocking code on Java side and Arduino side
 - Analog outputs driving servo motor and LEDs

19
